EDUCATION

M.S., Institute of Ecology and Evolutionary Biology, National Taiwan University, Taipei, Taiwan 2020-2023

Thesis title: *"Disentangling ecological processes underlying the metacommunity by integrating several analytical methods"*; Advisors: David Zelený

B.S., Department of Mathematics, National Taiwan University, Taipei, Taiwan 2016-2020

PUBLICATIONS AND CONFERENCES

Manuscripts

- **Huang, C.-L.**, Zelený, D., Chang-Yang, C.-H. Integrating several analytical methods to assess strength of ecological processes behind metacommunity assembly. (*minor revision, Oikos*)

Abstract: Numerous summary statistics have been developed to quantify the high-level ecological processes underlying real-world communities. We propose a comprehensive framework designed for the systematic evaluation and integration of different summary statistics across space and time. We also apply this framework to forest vegetation data, demonstrating how the integration of multiple summary statistics can enhance our estimation of the mechanisms underlying community assembly.

Conferences

- **Huang, C.-L.**, Zelený, D. (2022) How well do available methods quantify the importance of assembly processes in ecological community data: a simulation approach. The 10th Biennial conference of the International Biogeography Society

WORKING EXPERIENCE

Research assistant

- **Ke Lab, National Taiwan University** PI: Po-Ju Ke Starting Fall 2023

We study the decay trajectory of plant-soil microbe interactions and the interactive effects of microbial conditioning and decay time on plant community assembly. I will be responsible for the greenhouse experiments which aim to reconstruct the decay trajectory. We will also explore how age/stage-dependent plant-soil microbe interaction would affect competition consequences via theoretical modeling.

Part-time research assistant

- **Vegetation Ecology Lab, National Taiwan University** PI: David Zelený 2020-2022

We study how fog frequency affect plant taxonomic and functional turnover in multiple scales. I was partly responsible for field data collection, including overstory and understory census and leaf traits collection, as baseline data for testing the significance of conspecific and heterospecific trait-fog relationship. I was also responsible for identifying fog specialist species by analyzing data from herbarium and vegetation survey and remote sensing.

Teaching assistant

- **Introduction to Theoretical Ecology** ([Course Link](#)) Lecturer: Po-Ju Ke Fall 2022
- **Numerical Methods in Community Ecology** Lecturer: David Zelený Spring 2022
- **General Botany Lab** Lecturer: Fen-Ming Lee Fall 2021
- **Introduction to R for Ecologists** Lecturer: David Zelený Fall 2020
- **Calculus** Lecturer: Ya-Ju Tsai Fall 2019- Spring 2020

OTHER EXPERIENCE

Journal manuscript referee

- *Journal of Vegetation Science* (1 review)

Selected field survey experience

- | | |
|--|-------------|
| - Overstory and understory composition survey and leaf traits collection in fog frequency gradient transect in Northern Taiwan | 2021-2022 |
| - Leaf trait collection, and seedling survey in Fushan Forest Dynamics Plot | 2019-2020 |
| - Tree census in Lalashan Forest Dynamics Plot | 2019-2020 |
| - Tree and seedling census in Kenting Forest Recreation Area | Summer 2019 |
| - Tree census in Fushan Forest Dynamics Plot | Winter 2019 |
